

1. Product Requirements Document (PRD)

Product Name: Wazifa AI **Target Audience:** Pakistani students applying for local and international scholarships.

Problem Statement: Pakistani students face a chaotic, scattered process when applying for scholarships. They often lose track of documents, miss deadlines, and lack knowledge about relevant local scholarships. Furthermore, existing global tools (like ScholarPath AI) require entirely manual input, lack Pakistan-specific databases, and only offer guidance rather than executing tangible actions. Challenge 1 mandates an "Insight → Action" system rather than a basic summarization tool.

Core Value Proposition: Wazifa AI is an autonomous content-to-action agent that takes unstructured inputs (document photos), extracts insights, matches students to scholarships, and executes simulated application actions.

Key Features (Scope for Hackathon Demo):

- **Doc Vault:** Camera scanning of documents using OCR to auto-extract fields (e.g., CGPA, University) via Gemini Vision.
- **Scholarship Finder:** Hardcoded database of 15-20 Pakistan-relevant scholarships (HEC Need-Based, PEEF, Fulbright, DAAD).
- **Gap Radar:** Detects missing documents (e.g., Police clearance, recommendation letters) and flags priority sequences.
- **Action Engine (Simulation Chain):** Executes 3-5 interconnected actions instead of just suggesting them. This includes auto-drafting professor recommendation emails, simulating a mock application form fill, and generating a deadline calendar.
- **Readiness Dashboard:** Displays overall readiness percentage, an Urdu interface toggle, and critically, a before/after system state comparison for judges.
